

Held fixed in every primary arm
master-key context; accepted byte matrices; round keys; state rotation; AES S-box; routing; input panel

Only changed variable: public orientation exponent $e(r, j)$ in $R^{e(r, j)}(S_j)$

static
 $e(r, j) = 0$

position-only
 $e(r, j) = j \bmod 4$

round-only
 $e(r, j) = r \bmod 4$

rotor
 $e(r, j) = (r + j) \bmod 4$

Primary evaluation
byte-support screening invariant $\rightarrow$ 128-state Markov transfer system $\rightarrow$ context and start-state sensitivity
plus compressed finite-resolution diagnostics
